

Just me
Doing the class assignments. (AI won't learn for me. I have to do it for myself.)
Respond with my opinions to a Parallel Computing project teammate's questions. (AI isn't me. I have given my opinion.)

- 1 Respond to the question teammate always asks. An AI agent that will answer the any basic question, so that I won't need to waste my time.
2. Studying after class. Create an AI scan my notes and any relevant documents, and create a review document.
3. Gaining new ideas for side projects. An AI agent browses GitHub, Reddit, and other websites, and creates a list of trending side projects.

Delegate to AI with review
Computer Science Homework review. (I can delegate the homework reviewing task to AI.
Review my essay on Machine Learning Image Vision (I can delegate the essay reviewing task to AI.)
Review my Docker Compose file. (I can delegate to review my Docker Compose for my homelab to send if it works.

Collaborate with AI
Studying after class. (I can give the topic that I am currently studying to the AI, and it can create flashcards.)
Debugging the homelab's problem. (I can put the error message to AI, and it finds a solution for the issue.)
Studying an old topic that I already learned. (I can give a topic that I am already study to the AI, so I can review it.)
Gaining new ideas for side projects. (I can explore new ideas for side projects.)

Fully automate
Respond to the question teammate always asks
